

Development of a Computer Aided Learning Tool for Immunology

“LIME” – Learn Immunology More Easily”

Team-Members

Dr. K. Allenspach, Dr. B. Catchpole, Mr. N. Short, Dr. D. Werling

The original plan of this project was to develop a new e-directed learning tool which will be delivered through the Blackboard virtual learning environment (VLE). It was intended that the LIME resource developed within this project will provide students with the material which they can use at their own pace in order to foster a deep learning approach to complicated functional subjects in immunology.

Whereas it was originally planned to use existing resources, such as Immunology learning CDs initially and integrate the material eventually within the WikiVet project, the plan was changed and the whole immunology section was integrated from the beginning on into the WikiVet project, and forms now part of <http://www.wikivet.net/index.php/WikiBlood>

The content currently presented forms the base of an on-going development, which will link basic immunology teaching with clinical case based learning and will also incorporate quizzes for own evaluation possibilities.
